2025 Carbon Emissions Report

Greenhouse Gas

Scope 1

Scope 2

Scope 3

Report (January 1, 2025 – December 31, 2025)

Preface

Greenhouse Gas Inventory Report, ISO 14064-1 “Greenhouse Gases – Part 1: Greenhouse Gas Emissions and

This inventory was prepared in accordance with clause 7.3.1 of the “Narrow Guidelines and Specifications for the Calculation and Reporting of Dismissals at the Organizational Level” standard. The IPCC methodologies and national reference calculations valid during the inventory period were used as the basis for creating the inventory.

In this study, greenhouse gases generated within the scope of the organization's activities and environmental management were examined. Within this scope, it has been taken into consideration as a new performance criterion.

PREPARATION OF GREENHOUSE GAS EMISSION REPORT

What is a Carbon Footprint?

Carbon footprint is a term used to describe the amount of carbon that each person causes to be released into the atmosphere as a result of transportation, heating, energy consumption, or any product they purchase. Another In short, the production of energy required for every product we buy or every activity we carry out. It represents the total amount of carbon gas released into the atmosphere during a given period.

Climate change, which has been ongoing for millions of years under the influence of natural processes, is now caused by human activity. Environmental pollution has further increased its impact and damage. The clean and healthy environment we inherited from the past... Every individual and organization has a responsibility to ensure that the environment is passed on to future generations as it should be. That is a fact. In this context, we aim to demonstrate our sensitivity towards the environment and climate, as well as the environment. Calculating our carbon footprint in order to make a concrete contribution to the measures taken against pollution and Working on reducing carbon footprints, especially fossil fuels, has become an important task. Since it is a definition based on energy obtained from fuels, reducing the carbon footprint also This means reducing or optimizing energy consumption. This is important for businesses. Reducing energy costs can only be achieved with a package of measures that will initiate a cycle of change. Carbon footprint analysis essentially means developing a new energy usage culture for organizations. It is coming.

In addition to each activity having a different carbon footprint, studies conducted on an individual or company basis show... Various factors need to be taken into account. Internationally, carbon footprint calculations require different factors to be considered. Various methods and standards have been developed. Among the standards addressing the six main greenhouse gases (CO2, CH4, N2O, PFc, HFc, SF6) evaluated under the Kyoto Protocol, the Intergovernmental Climate Change Standard is prominent. In addition to the methods published by the Intergovernmental Panel on Change (IPCC), the GHG Protocol, ISO 14064, and CDP are also used. PAS 2050 is coming.

Calculating Greenhouse Gas Emissions - Processes Followed - Defining the Objective

Carbon footprint calculation is about determining the goals to be achieved. For example, carbon footprint results...
It can be used in setting **CO2 reduction targets and identifying potential CO2 reduction measures.**

Determining Borders

Once the objective is determined, the limits for carbon footprint (the limits specified in the applicable standards) are defined. Various selections should be made to determine (while remaining within) the scope. The most common options for corporate reporting are... The scope used is operational control scope. This refers to the organization's daily operational controls. will calculate and account for the carbon footprint resulting from all activities under its purview. This means that the company will receive certain emissions outside of its own activities. will be taken into consideration.

The establishment of the organization's boundaries and limited control over property. Due to its responsibility, the approach used in calculating emissions has been selected as the 'control approach'. Any changes made to the selected method... The change will be announced in the following year's greenhouse gas report, and calculations will be based on the base year. It will be renewed.

Data Collection and Application of Emission Factors

Once the limits and scope of the Carbon Footprint are agreed upon, specific data will be provided for the activities.

Data can be collected and used to calculate emission factors and global warming potentials. This method of collecting

information is called an inventory. Emission factors can vary from country to country and over time.

It can change. There are many sources for emission factors, such as the IPCC guidelines and the WBCSD's GHG Protocol.

It is available.

Evaluation of Results and Reporting of Footprints

The report should be transparent, and the choices and assumptions made should be clearly stated.

Selection of the Calculation Method

In greenhouse gas calculations, the IPCC, Level-1 Methodology, and Level-2 Methodology for activity data containing national information were used. Since production data from Turkish Electricity Generation Inc. (TEÿAÿ) is used in electricity emission factor calculations, the Level-2 methodology is used for Scope 2 energy-related greenhouse gas emissions. Accordingly, the following formulas and variables are used in the calculations of Scope-1 and Scope-2 greenhouse gas sources. Emissions in Scope-3 are also calculated according to the following formula.

Emissions, fuel = EmissionCO2, fuel + EmissionCH4, fuel + EmissionN2O, fuel EmissionCO2,
fuel = Consumption Amount, fuel X Emission FactorCO2, fuel

Due to the lack of sufficient technological infrastructure for measuring all emission sources, a calculation methodology

was chosen. A measurement methodology was not used. This calculation method addresses uncertainty.

This can be reflected in the results. Energy requirements are met solely by electricity. Big mass.

It does not use energy sources classified as biomass. For this reason, biomass utilization...

No relevant calculations have been made.

Selection of Greenhouse Gas Emission Factors

Greenhouse gas emission values resulting from the consumption of imported electricity, calculated separately in CO2

equivalent tons, can be found for Turkey at www.ea.org/CO2highlights.

Since the factor value was determined, the calculation was performed according to the TIER 2 approach. CO2 equivalent

Calculated separately per ton. Greenhouse gas emission values resulting from diesel fuel consumption of company

vehicles can be found at www.ea.org/CO2highlights for Turkey's emission factor.

Since the value was not specified, the calculation was performed using the TIER 1 approach.

This study shares greenhouse gas emissions (carbon footprint) for the organization in 2025.
The corporate carbon footprint was calculated separately, covering the period
from January 1, 2025 to December 31, 2025, with 2025 as the 'base year'.

GREENHOUSE GAS INVENTORY AND CORPORATE CARBON FOOTPRINT CALCULATION

Activity	Activity Categories	Activity Version	Scope	Greenhouse Gases
Heating System	Constant Burning	Natural gas (m^3)	Directly (Scope 1)	CO2 CH4 N2O
Air Conditioning Gases	Illicit Emissions	Air conditioning gas kg (Not calculated)	Directly (Scope 1)	R410a
Passenger Vehicles	Moving Combustion	Motorn (lt)	Directly (Scope 1)	CO2 CH4 N2O
Fire Extinguishers	Leakage Emissions	Fire Extinguisher (kg)	Indirect (Scope 2)	FM200 CO2
Electricity Consumption	Electricity	kWh	Indirect (Scope 2)	CO2
Transportation Activities	Moving Combustion	Motorn (lt)	Indirect (Scope 3)	CO2 CH4 N2O
Dangerless Waste Recovery	Open Loop	kg	Other Indirect Value (Scope 4)	CO2

Findings and Acceptances

Greenhouse Gas	Global warming Potential (GWP)
CO2	1
CH4	28
N2O	265

In calculating greenhouse gas emissions from natural gas;

Natural gas consumption is determined by reading the natural gas supplied from the main network via a natural gas meter.

In calculating illicit emissions;

The emission factor of R407C type refrigerant is determined under the "Kyoto Protocol". The data was obtained from the “EPA-Greenhouse Gas Emsson Calculator” system.

For air conditioners, the annual loss/leakage amount is accepted as 4.5% of the gas filled. (Certainty=±10%) Source: “IPPC-Specal Report on Safeguarding the Ozone and the Global Clear System-Chapter 5: Resdental and Commercal Ar

In the calculation of fire extinguishing systems;

Leakage rates for portable CO2 fire extinguishers are 4% of the gas weight inside the cylinder. It is accepted as (Uncertainty=±2%). “Source: IPPC-Specal Report on Safeguarding the Ozone and the Global Climate System- Chapter 9: Free Protecton- Table 9.2

In calculating CO2 systems used for cooling purposes;

Transportable primary CO2 intakes have been included in the calculations as direct carbon emissions. Motornn's emission factors included in the report are from the "EPA- Greenhouse Gas Emission Calculator". It was obtained from the tables.

Direct Greenhouse Gas Emissions (Scope 1)

Heating System

Heating system total amount of natural gas consumed.			14702 m3
Activity data		Emission factor	Emission amount
14702 m3 EF CO2 =		2.040 kg/m3 29992.080	kg CO2-equivalent
14702 m3 EF CH4 =		0.003 kg/m³ 44.106	kg CO2-equivalent
14702 m3 EF N2O =		0.001 kg/m³ 14.702	kg CO2-equivalent
TOTAL EQUIVALENT DUE TO HEATING GREENHOUSE GAS EMISSION AMOUNT			30050,888 kg CO2-equivalent

Air Conditioning System

Since there is no data on greenhouse gas emissions leaks from air conditioning systems for the year 2025, this figure has not been included in the calculations.

Passenger Vehicles

Consumption of passenger vehicles in 2025; Consumption of generators in 2025.

Total amount of diesel fuel consumed from vehicles and generators.			1000 lt
Activity data		Emission factor	Emission amount
1000 lt EF CO2 =		2.51 kg/lt 2510,000 kg CO2-equivalent	
1000 lt EF CH4 =		0.00029 kg/lt 0.290	kg CO2-equivalent
1000 lt EF N2O =		0.033 kg/lt 33,000	kg CO2-equivalent
FROM VEHICLES AND GENERATORS TOTAL EQUIVALENT GREENHOUSE GAS EMISSIONS EMISSION AMOUNT			2,543,290 kg CO2 equivalent

Fire Extinguishers

It is predicted that **in 2025, the amount of CO2 leaking from fire extinguishers will be significant.**

CO2 Cylinder					71 kg
Tube type	changing tube quantity	tube kg	Total kg	Activity data	Emission amount
CO2 Cylinder	11	6	66 kg	1 kg/	66,000 kg CO2-equivalent
HFC-227ea (FM200)	1	5	5 kg	3,350 kg/	3350,000 kg CO2-eq
TOTAL EQUIVALENT GREENHOUSE GASES FROM FIRE EXTINGUISHERS EMISSION AMOUNT					3,416,000 kg CO2 equivalent

Indirect Greenhouse Gas Emissions - Electricity Consumption (Scope 2)

Electricity consumption is the total amount of electricity consumed.		50889 kWh
Activity data	Emission factor	Emission amount
50889	0.493 CO2-equivalent/kWh	25088 kg CO2-equivalent
CAUSED BY ELECTRICITY CONSUMPTION TOTAL EQUIVALENT GREENHOUSE GAS EMISSIONS AMOUNT		25088 kg CO2-equivalent

Transportation Activities (Scope 3)

Business trip total km			750 km
Activity data		Emission factor	Emission amount
750 KM EF.CO2 =		0.080 kg/km	60 kg CO2-equivalent
TOTAL KILOMETERS FROM BUSINESS TRIPS EMISSION AMOUNT			60 kg CO2-equivalent

Recovery/Disposal of Non-Hazardous Waste (Scope 3)

Waste Type	Waste Amount (kg)	Emission Factor	Annual COÿ Emissions (kg)
Organic Waste	536.33	0.446	239.20318
Paper Waste	2861	0.022	62,942
Plastic Waste	2230	0.022	49.06
Mixed PACKAGING	480	0.022	1081
Total			1432.20518

TOTAL EQUIVALENT GREENHOUSE GAS EMISSION AMOUNT

TOTAL EQUIVALENT GREENHOUSE GAS EMISSION AMOUNT		
TOTAL EQUIVALENT GREENHOUSE GASES FROM HEATING EMISSION AMOUNT	30050,888	COÿ (kg)
TOTAL FROM VEHICLES AND GENERATORS EQUIVALENT GREENHOUSE GAS EMISSION AMOUNT	2543,290	COÿ (kg)
TOTAL EQUIVALENT GREENHOUSE DAMAGE CAUSED BY FIRE EXTINGUISHERS. GAS EMISSION AMOUNT	3,416,000	COÿ (kg)
TOTAL EQUIVALENT FROM ELECTRICITY CONSUMPTION GREENHOUSE GAS EMISSION AMOUNT	25088,277	COÿ (kg)
TOTAL KILOMETER EMISSIONS FROM BUSINESS TRAVEL AMOUNT	60	COÿ (kg)
RECOVERY/DISPOILAGE OF NON-HAZARDOUS WASTE	1432.20518	COÿ (kg)
